

VDB-306801 · CVE-2025-4183 · GCVE-100-306801

PCMAN FTP SERVER 2.0.7 RECV COMMAND BUFFER OVERFLOW

A vulnerability classified as critical has been found in PCMan FTP Server 2.0.7. This affects an unknown code block of the component *RECV Command Handler*. The manipulation with an unknown input leads to a buffer overflow vulnerability. CWE is classifying the issue as CWE-120. The product copies an input buffer to an output buffer without verifying that the size of the input buffer is less than the size of the output buffer, leading to a buffer overflow. This is going to have an impact on confidentiality, integrity, and availability.

The advisory is shared at fitoxs.com. This vulnerability is uniquely identified as CVE-2025-4183. The exploitability is told to be easy. It is possible to initiate the attack remotely. No form of authentication is needed for exploitation. Technical details are unknown but a public exploit is available.

The exploit is shared for download at fitoxs.com. It is declared as proof-of-concept.

There is no information about possible countermeasures known. It may be suggested to replace the affected object with an alternative product.

Entries connected to this vulnerability are available at VDB-306694, VDB-306798, VDB-306799 and VDB-306800.
