vp_vdpa: fix the crash in hot unplug with vp_vdpa

commit aed8efddd39b3434c96718d39009285c52b1cafc upstream.

While unplugging the vp_vdpa device, it triggers a kernel panic
The root cause is: vdpa_mgmtdev_unregister() will accesses modern
devices which will cause a use after free.
So need to change the sequence in vp_vdpa_remove
