CVE-2025-46193

SourceCodester Client Database Management System 1.0 is vulnerable to unauthenticated remote code execution via arbitrary file upload in user_proposal_update_order.php. The application fails to validate file types, MIME types, or file extensions when handling uploads through the uploaded_file_cancelled field. An attacker can upload a malicious PHP file to the web-accessible /files/ directory, resulting in unauthenticated execution of arbitrary commands on the server.
